Trust the Card, Not the Resemblance

Muhan Chen
Duke Kunshan University
Kunshan, China
mc956@duke.edu

Inherited: trust game; cheap talk. **Contribution:** printed forfeit; the label cannot waive it. **Evidence:** Nashpy. The pairs do not show that people follow the card.

Figure 1: Completed evidence is the forfeit matrix and the Nashpy check. The seven pairs are exploratory: Keep stayed 15/28. No procurement impact is claimed.

Submission to: COMSCI/ECON 206 — Computational Microeconomics.
Course session: Autumn 2026 Session 1. **Team:** FP12. **Final week:** October 12 and 14, 2026.
Course instructor: Professor Luyao Zhang. **Assignment:** Final project revised research submission.

1 Background

An AI negotiation screen can copy a user's priorities and tone. Two people then face a public payoff card and a SAME/DIFFERENT label. In PS1, Trust and Verify pay the Decider the same when the Promiser's Keep probability is $p^* = 0.6$. That Promiser did not choose [4]. A trust game lets the second mover repay trust [1]. Cheap talk need not change a payoff [5]. The open issue is which public rule makes Trust an equilibrium when the card rewards a break.

2 Motivation

The decision that needs evidence is whether to show the card and a forfeit before both choices lock. PS1 is not enough: its Promiser action was a probability, not a choice. The gap is not that trust matters in general. A similarity label can sit beside a card that still rewards a break.

3 Application Scenario

The case is a procurement screen that copies the buyer's priority and tone. The supplier is the Promiser and can Keep or Break. The buyer is the Decider and can Trust or Verify. Payoffs are illustrative. The seven pairs are a class exercise, not a procurement sample. If the forfeit is not collected, this is not a purchasing rule.

4 Research Question

Shared question. When the payoff card is misaligned, what public rule makes Trust a Nash equilibrium even if a SAME/DIFFERENT label is on the screen?

Economics. Does a forfeit of 5, larger than the 4-point gain from Break, change the unique equilibrium?

Computation. Does Nashpy return that equilibrium, and does the PS1 seed-206 replay still total 48, 24, 22, and 18?

Behavior. Do the seven pairs' choices lie closer to the card or to the label? Order was not separated, so the comparison is descriptive only.

5 Method

The Promiser chooses Keep or Break. The Decider chooses Trust or Verify. Both lock before either choice is shown. The card is public. Aligned Keep/Break payoffs are 6 and 3. Misaligned payoffs are 6 and 10 before the forfeit. The Decider receives 6, −4, or 2. The Promiser's payoff does not depend on Trust. The label changes no cell and cannot waive a forfeit. Twelve rounds use a fresh card. Scores do not carry over.

	Keep	Break
Trust	(6, 6)	(−4, 3)
Verify	(2, 6)	(2, 3)

	Keep	Break
Trust	(6, 6)	(−4, 10)
Verify	(2, 6)	(2, 10)

	Keep	Break
Trust	(6, 6)	(−4, 5)
Verify	(2, 6)	(2, 5)

Aligned; misaligned, no forfeit; misaligned, forfeit of 5. Cells are (Decider, Promiser).

Keep strictly dominates on the aligned card, so the unique pure Nash equilibrium is (Trust, Keep) [9]. With no forfeit, Break strictly dominates on the misaligned card, so the equilibrium is (Verify, Break), with payoffs (2, 10). The forfeit of 5 is lost by the Promiser, not paid to the Decider. Because $6 > 5$, the equilibrium is (Trust, Keep), with payoffs (6, 6). From (2, 10) to (6, 6), the Decider gains 4 and the Promiser loses 4. The total stays 12. The collective aim is that the Decider is not exploited and that the rule can be challenged. The cost is the fall in the Promiser's payoff. The tested rule is the printed forfeit. The label cannot replace it. The flip fails if Break's gross payoff exceeds 11 or the forfeit is not collected. Nashpy checks the same three matrices.

The auction is a boundary, not this result. Two bids choose the Promiser, not the Decider. On a misaligned Break the forfeit equals the second bid. Above 4, the equilibrium is (Trust, Keep). Below 4, it is (Verify, Break). At 4, there is no unique equilibrium. Appendix F matches $(9, 6)$, $(8, 3)$, and $(4, 4)$ to the fixed 5. The auction was not played.

6 Results

Computed output: Nashpy returns the three equilibria. The seed-206 replay, not a human sample, totals 48, 24, 22, and 18. With no people, the twelve cards score 56 for the Decider and 88 for the Promiser.

Exploratory play: seven pairs, code 206, 84 locked rounds. Forfeit cards are always rounds 5, 7, 11, and 12, so the forfeit is not separated from order. Keep is 14/28 on the aligned card, 15/28 on the misaligned card, and 15/28 on the forfeit card. On the aligned card Break pays 3 and Keep pays 6, so Break has no strategic reason. Keep near one half is therefore not evidence that the forfeit failed.

Trust is 16/28 on the aligned card, 18/28 on the misaligned card with no forfeit, and 26/28 on the forfeit card. The model predicts Trust on every aligned round. Aligned Trust is not higher than Trust on the misaligned card with no forfeit, so the two cards are not separated. Across pairs, the Trust contrast on forfeit cards rose in five, was unchanged in two, and fell in none. The Keep contrast on those cards rose in two, was unchanged in two, and fell in three. On the forfeit card, Keep is 15/28, so the expected payoff from Trust is $10 \times 15/28 - 4 \approx 1.36$, below Verify's 2, yet Trust was chosen in 26/28 of those rounds. Trust was higher on the rounds where the forfeit appeared, but those rounds are mixed with order, and Trust on the aligned card was not high. In pair 3, aligned Trust was 0/4 while aligned Keep was 1/4, so that Decider may have been following earlier Keep rather than the card. SAME Trust is 28/42 and DIFFERENT Trust is 32/42. Appendix A has the pair rows. No p-value is reported.

7 Intellectual Merits

Before the investor decides, Bracht and Feltovich have the allocator place an amount into escrow, forfeited if the allocator keeps the proceeds. The abstract says the escrow may be chosen or imposed, and reports efficient outcomes when the high amount is chosen, and the same pattern when it is imposed [2]. This paper inherits the precommitment. It does not inherit a chosen deposit. The forfeit of 5 is printed before either choice. Neither player posts it.

Fehr and Rockenbach report that a sanction which reveals a selfish or greedy intention destroys altruistic cooperation, while a sanction seen as fair leaves it intact [6]. Their article describes an investor and that investor's desired back-transfer. Our forfeit is printed on the card. The Decider does not choose it. We did not ask whether the pairs saw it as fair.

Giang, Bell, and Buchner found that a morphed self-resemblant face did not raise cooperation [7]. Our cue is a priority label, not a face, and Trust was not higher under SAME. The distinct contribution is a forfeit printed on the public card, which the label cannot waive, plus paired choices by two humans. Nashpy agrees. The forfeit is assumed collected, and the Promiser's payoff does not depend on Trust. The pairs do not show that people follow the card.

8 Practical Impacts

Target 16.6 is "Develop effective, accountable and transparent institutions at all levels." Target 10.2 is inclusion of all, irrespective of economic or other status, and of the other grounds quoted in Appendix H [12]. The buyer is the Decider. The supplier is the Promiser and pays a collected forfeit. The proposed indicator is whether the card, the forfeit, and the appeal route are visible before both choices lock. Indicators 16.6.1, 16.6.2, and 10.2.1 are not used.

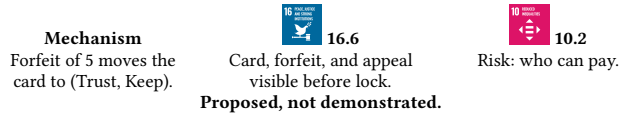

Figure 2: Impact diagram. Stakeholders: Decider and Promiser. Baseline and safeguard: Appendix H.

The baseline is the misaligned card with no forfeit, and the pairs did not raise Keep. A written objection before collection is proposed only. It is not in the model or the Space. Any filing fee would be capped or waived. That tension stays in the affordability test. If the forfeit is not collected, the flip is not claimed.

Future Research Roadmap

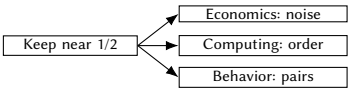

Figure 3: The limit leads to three studies. Appendix G has the five fields.

Keep stays near one half where Keep is strictly better. Economics asks whether noise around expected payoff, or a belief that collection fails, explains it [8]. Computing asks this Space to randomize order, ask a payoff question, and show collection [3]. Behavior starts from these pairs, including pair 3, and asks for at least 10 new pairs. Appendix G.1 has the remaining fields.

The flip is withheld if Break's gross payoff exceeds 11 or the forfeit is not collected. Before any new sessions, this rule is fixed: among at least 10 pairs who pass the payoff check and can see whether the forfeit was collected, if the number of pairs with higher Keep is not greater than the number with lower Keep, a tie included, replace the imposed 5 with an escrow the Promiser chooses. This is a preset decision rule, not a statistical test. An imposed escrow was also efficient in Bracht and Feltovich, so the switch tests whether a self-chosen commitment raises Keep more. It is not their finding.

Evolving 2056 Contribution Statement

By 2056 the aim is a tested rule for when a copied style cannot replace a public card. On 12 October 2026 the official prize went to Robert E. Hall and Michael Woodford. The 2025 prize went to Joel Mokyr, Philippe Aghion, and Peter Howitt [10, 11]. Checked on 19 October 2026 from the official pages, not in class on 14 October. The 2056 statement does not change. The 2025 prize recognizes the explanation of innovation-driven growth, and the 2026 prize recognizes the microeconomic foundations of macroeconomic stabilization. I read both as reducing a large question to a concrete mechanism. This roadmap likewise starts from why Keep stays near one half.

Open Science and SDG Statements

Commit `b1380f7` is the tested model. Targets 16.6 and 10.2 are proposed, not shown.

Author Notes

Full Acknowledgments

I thank Prof. Luyao Zhang for the PS1 final review of 25 September 2026, which required a two-sided game and visible matrices. This paper implements both. I thank Prof. Kenneth S. (Ken) Rogerson for asking us, as Program Discussant of the 7 September 2026 workshop, to say what practical decision the result could inform, and to keep a classroom result separate from a real-world effect. I thank Han Zhang for asking me to make the comparison in the paper easier to see, and to say who would be affected by the rule.

I thank Zijie Wang and Lin Zhang, FP7, classmates who gave ideas in class on 12 and 14 October 2026. On 12 October, Zijie Wang selected Bracht and Feltovich (2008), Fehr and Rockenbach (2003), and Giang, Bell, and Buchner (2012), and noted that Keep stayed near one half. Lin Zhang worked through that duet with him. Classmates whose teams I reviewed, or who reviewed this project, are invited to tell me if their names are missing. I will correct the paper and the poster. The thread is https://edstem.org/us/courses/102917/discussion/8391519?comment=19481056. The 28 September 2026 discussion concerned a withdrawn draft of a different model. Those comments are not reviews of this paper.

I acknowledge Tencent's Shanghai office for hosting the 4 September 2026 visit, including the technology exhibition and AI chatbot session that framed a screen copying a user's priorities. I acknowledge the Shanghai Science and Technology Museum for the public AI exhibition on that visit. I acknowledge the whole COMSCI/ECON 206 classroom community for the seven paired sessions and the 12 October duet. The field-learning context is the course newsletter at https://cscc.dukekunshan.edu.cn/where-scholarship-industry-and-public-science-meetfield-based-learning-and-interdisciplinary-dialogue-for-future-global-leaders/.

The seven sessions are in `data/`. The game uses Python, Nashpy, JavaScript, Colab, GitHub, and Hugging Face. The repository states an MIT license, copyright 2026 Muhan Chen. AI assistance is disclosed in Appendix A.2. The acknowledgment list above is the list for the paper and the poster.

Updated Team and Individual Contributions

Muhan Chen is the sole author. The intellectual decisions were to make the Promiser a player, to set the forfeit at 5 because Break gains 4, to keep the similarity label outside the matrix, and to have two people play. The outputs are the GitHub repository, the Colab notebook, the Hugging Face game, the seven session files, and this paper. The checks are the dominance argument, the three Nashpy results, and the seed-206 replay. The human sample is the seven pairs. As the sole author, I am responsible for every section and deliverable. Ideas from peers and classroom contributors are in the acknowledgments.

A Technical Details and Reproducibility

Players are two humans: Promiser (Keep or Break) and Decider (Trust or Verify). The aligned Keep/Break payoffs are 6/3. The misaligned payoffs are 6/10 before the forfeit and 6/5 after it. Decider payoffs are 6, −4, and 2. SAME/DIFFERENT changes no payoff. Actions are hidden until both lock. A session has twelve fresh rounds and no carried score. The PS1 benchmark $p^* = 0.6$ is reproduced. It is not an input to the new equilibrium.

The checked commit is short id `b1380f7`. The full hash is b1380f743b278819d514ec24a36aef89eb062829. Colab Runtime → Run all reproduces the matrices and the totals 48, 24, 22, and 18. Twelve tests pass, including JavaScript–Python agreement. Nashpy returns the three pure equilibria named in Section 5.

A.1 Pair-level record

Each row is one file. Keep contrasts are forfeit minus no forfeit, out of four misaligned cards of each kind. Trust uses the same split. The label split is out of six rounds. Every pair is balanced: six SAME, six DIFFERENT, and two of each label inside each card type.

Pair	Keep, al.	Trust, al.	Keep, none	Trust, none	Keep, forf.	Trust, forf.
1	3/4	3/4	2/4	2/4	1/4	4/4
2	3/4	2/4	3/4	2/4	2/4	3/4
3	1/4	0/4	3/4	3/4	3/4	3/4
4	2/4	3/4	2/4	2/4	4/4	4/4
5	1/4	2/4	2/4	2/4	2/4	4/4
6	1/4	2/4	1/4	4/4	2/4	4/4
7	3/4	4/4	2/4	3/4	1/4	4/4

Al. means the aligned card. None means the misaligned card with no forfeit. Forf. means the forfeit card. Each cell is out of 4. Aligned Trust totals 16/28. Aligned Keep totals 14/28. Rounds

within a pair are not independent, so this paper reports no p-value.

Pair	Trust, SAME	Trust, DIFFERENT
1	4/6	5/6
2	3/6	4/6
3	2/6	4/6
4	5/6	4/6
5	4/6	4/6
6	5/6	5/6
7	5/6	6/6

Keep contrasts are $-1, -1, 0, +2, 0, +1, -1$. Trust contrasts on the forfeit are $+2, +1, 0, +2, +2, 0, +1$: five pairs up, two unchanged, none down. SAME-minus-DIFFERENT Trust contrasts are $-1, -1, -2, +1, 0, 0, -1$: one pair higher on SAME, two equal, four higher on DIFFERENT.

A.2 AI Use Disclosure

AI-Assisted. The author remains responsible for the claims, the sources, and the computation.

On 29–30 September 2026 a Cursor coding agent implemented the repository, the notebook, and the Hugging Face game from the author's locked model. Accepted: two human players, a forfeit of 5, the three matrices, and Nashpy. Rejected: an AI player, a personal-drive Colab link, and invented human data.

On 5 October 2026 the same class of tool arranged the public README and placed the existing paper, poster export, and static game. No payoff, equilibrium, or classroom count was changed.

On 19 and 20 October 2026 the roles were separate. Claude Sonnet 5.5 planned the revision, reviewed each draft, wrote the revision instructions, and checked the 2026 Nobel prize page. Claude did not edit this paper. A Cursor assistant, using the model Grok 4.7, made the edits. That assistant opened https://sdgs.un.org/goals/goal16, https://sdgs.un.org/goals/goal10, and the 2025 and 2026 Nobel pages, and recomputed the pair counts from the seven CSV files. It did not add sessions or change a payoff.

The material prompts asked for an eight-part final paper within two pages, the three Set A papers, a pair-level reading of the seven sessions, a matched auction table, a roadmap with five fields for each study, and no invented data, names, or SDG indicators. The author chose Set A, confirmed the auction table and the rule of at least 10 new pairs, named Zijie Wang and Lin Zhang as the in-class contributors of ideas, and supplied the Ed thread. The author also required the aligned-card Trust count of 16/28, the social-choice tradeoff, and the separation of a classroom result from a causal claim. Those directions are the human changes in this draft.

B Cumulative Intellectual Development

PS1 asked when Trust was worth $p^* = 0.6$ and kept the Promiser's action exogenous. Its graded seed-206 totals are +48, +24, +22, and +18. The final PS1 review of 25 September 2026 scored 75.57/100. Research Quality was 59/100, Research 50.57/60, and Revision 0/15, because an implemented change was not visible. The review required a choosing Promiser and visible matrices.

PS2 made the Promiser a player and set the forfeit at 5. The 14 October 2026 team feedback scored that PS2 at 18/20. The lowest row was the auction comparison, 1.5/3, because the rule had no matched baseline. This final adds that baseline in Appendix F. It does not replace the forfeit model with an auction paper. The 28 September discussion stays out of the review record. The final-week additions are in Appendix G.

C Open Source and Three Lens Inspiration

The shared question is the public rule that makes Trust an equilibrium on a misaligned card. Game theory supplies strict dominance and pure Nash equilibrium. That lens is the course's Strategic Thinking check. Social choice records the tradeoff from (2, 10) to (6, 6): the Decider gains 4, the Promiser loses 4, and the total stays 12. Joining that objective to the code and to the seven pairs is the Interdisciplinary Contribution check. Mechanism design states the rule that is tested: a forfeit of 5 on a misaligned Break, which SAME cannot waive, with a proposed, untested appeal route and a named payer. That safeguard is the Global Leadership check. The human record then qualifies the prediction.

Computation uses Nashpy for the matrices, Python and Colab for the replay, and JavaScript for the game page. The source is the course repository named in Section 5, under the MIT license in that repository. The Hugging Face Space is the two-player interface. oTree is cited only as a design source for randomized display [3]. This project does not run on oTree.

D Feedback Response and Revision Record

Muhan Chen is the responsible author of every row.

Source and date	Claim	Decision and reason	Place and check
Luyao Zhang, 25 Sep 2026	No choosing Promiser	Revise. The review required a visible two-sided game.	Section 5. Nashpy matches at `b1380f7`.
Class, 28 Sep 2026	Withdrawn draft	Keep out. Those comments were about another model.	Not cited as a review of this paper.
FP12 feedback, 14 Oct 2026	One-sided design	Keep. The correction is already the model.	Background.
Same feedback	Three equilibria; Keep unchanged	Keep. The unchanged Keep is the useful result.	Sections 5 and 6.
Same feedback	Auction had no matched baseline	Revise. The score was 1.5/3 for that gap.	Appendix F. Not played.
Same feedback	Computation	Keep. The finite checks matched.	Commit `b1380f7`.
Same feedback	Poster needs enforcement and affordability	Revise. Both were missing from the impact claim.	Section 8 and Figure 2.
Same feedback	Paper and poster checkpoints	Revise. The artifacts must show the same three matrices.	Section 5 is the checkpoint.
Same feedback	Author notes	Keep. This model stays separate from the withdrawn draft.	Author Notes.
Same feedback	84 rounds cannot isolate the forfeit	Revise the wording. The cause is still open.	Section 6 and Appendix A.1.
Zijie Wang, 12 Oct 2026	Three papers; Keep near one half	Investigate. The papers bound the claim. They do not replace it.	Section 7. Abstracts opened 19 Oct 2026.
Self-challenge, 14 Oct 2026	A fine of 5 was treated as given	Investigate. Collection and comprehension are untested.	Roadmap. Not rerun.
FP7, 14 Oct 2026	Their signal needs compliance	Their rerun was not run. The same question changed this roadmap.	Roadmap now tests collection.

E Structured Abstract and Cumulative Proposal Map

Part	Current statement
Background	Two players, a public card, and a label. PS1 did not let the Promiser choose.
Motivation	The needed evidence is whether the card and forfeit are shown before the choice locks.
Application Scenario	A procurement screen. Illustrative payoffs. Seven class pairs. Not a field sample.
Research Question	Which public rule makes Trust an equilibrium on a misaligned card, even with a label on screen?
Method	Simultaneous choice, three matrices, pure Nash, Nashpy, and a second-bid boundary.
Results	Computed equilibria. Exploratory pairs: Trust contrast up in 5, unchanged in 2, down in 0. Keep stays 15/28.
Intellectual Merits	Printed forfeit, not a chosen deposit; sanction-fairness not asked; label is not a face.
Practical Impacts	Targets 16.6 and 10.2 are proposed. No impact is demonstrated.

F Retained PS2 Auction Artifact and Symposium Record

This record keeps the PS2 auction boundary. It is not the contribution. Two prospective Promisers submit nonnegative integer bids. The higher bidder becomes Promiser. A session seed breaks a tie. The bid does not select the Decider. SAME/DIFFERENT cannot change a bid. On a misaligned Break, the Promiser pays the second bid. On Keep, payment is 0. Break payoff is 10 minus that payment. Revenue below is the payment on the equilibrium path.

The 28 September 2026 symposium comments were about a withdrawn draft. They are not this auction. No one has played these bids.

Case	Who	Fine	Break	Equilibrium	Revenue
Fixed 5	Assigned	5	5	(Trust, Keep)	0
Bids (9, 6)	Bidder of 9	6	4	(Trust, Keep)	0
Bids (8, 3)	Bidder of 8	3	7	(Verify, Break)	3
Bids (4, 4)	Seed breaks tie	4	6	Not unique	Open

Payment after Break equals the Fine column. On the (Trust, Keep) path that payment is not made. A fixed forfeit of 5 keeps (Trust, Keep) in this table. A second-bid forfeit keeps (Trust, Keep) only when the second bid is greater than 4. Bids (8, 3) fail that test: the equilibrium is (Verify, Break), and revenue on that path is 3.

G Final Week Evidence and Final Release Audit

12 October 2026. The claim taken into class was the printed forfeit of 5. FP7 and FP12 exchanged three papers. The three used here are the Set A papers in Section 7. Confirmed response: the seven pairs do not show that people follow the card, and order is mixed with the forfeit. The award offered to FP7 recognized that their coordination signal raised alignment and fees together in their simulation. That result is theirs. Ed thread: https://edstem.org/us/courses/102917/discussion/8391519?comment=19481056. Zijie Wang and Lin Zhang are credited for ideas given in class.

14 October 2026. The self-challenge was that the Promiser is paid the same whether anyone trusted, and that a fine of 5 was treated as given. The three challenges are answered as follows. Strategic thinking: the prediction requires the printed, collected forfeit; the Promiser's payoff does not depend on Trust. Social choice: both equilibria total 12, and the Deciders' mean session score was about 19.7, not the no-person total of 56. Mechanism design: the rule was not isolated, because order was fixed and collection was assumed. The next test is the roadmap. The official prize pages are cited in the 2056 statement only as examples of scientific statement, not as this project's finding.

20 October 2026. After the 14 October symposium, I emailed Prof. Rogerson from my own account. I described the verified result and asked one question: if ten new pairs pass the payoff check and see collection and still do not Keep more, should the fixed forfeit be replaced by a deposit the Promiser chooses to post? No reply as of 20 October 2026.

G.1 Roadmap fields

Each study below is a plan. None has been run. Possible collaborators are roles, except the two named partners.

Field	Content
Economics question	Why does the Promiser break when Keep is strictly better, on the aligned card or the forfeit card?
Method or data	A quantal-response note [8], plus the belief about collection that would make Break a best response. Seven pairs do not identify either story.
Possible collaborator	Zijie Wang and Lin Zhang (FP7), if they agree.
Progress criterion	The note states whether noise, or a stated belief about non-collection, can put Keep near one half.
Milestone	That note beside the current matrix.
Computer-science question	Can this Space randomize card order, ask one payoff question, show whether the forfeit was collected, and write pair contrasts before new sessions are read?
Method or data	Add those controls to the existing Hugging Face Space. A browser experiment can randomize a screen [3]. This project does not move to oTree. A test file is not human evidence.
Possible collaborator	A software or HCI coauthor.
Progress criterion	A fresh run shows the three controls and writes a pair-level table from the test file.
Milestone	One commit after `b1380f7` with the script.
Behavioral question	Once order is counterbalanced, the payoff check is passed, and collection is visible, is pair-level Keep higher on forfeit cards?
Method or data	At least 10 new pairs, not only code 206. Record who can pay. The aligned-card Keep rate of 14/28 is this paper's reason for the payoff check and the real stake.
Possible collaborator	A behavioral-science lab.
Progress criterion	The pair-level Keep contrast among pairs who pass the check and see collection.
Milestone	One new session file. None exists.

G.2 Roadmap diagram

Figure 4 is the expanded form of the roadmap in the main text. The icons mark proposed outcomes, not completed impacts.

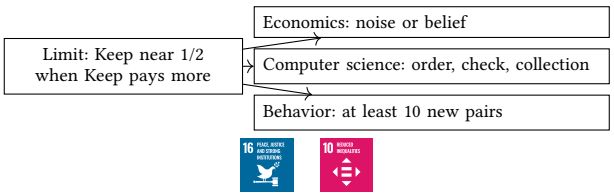

Figure 4: One limit, three next studies. Goal 16 marks a visible rule. Goal 10 marks who can pay.

H Practical-impact fields

Field	Content
Mechanism	A collected forfeit of 5 moves the misaligned card from (Verify, Break) to (Trust, Keep). The label cannot waive it.
Stakeholders	The buyer is the Decider. The supplier is the Promiser. The Promiser pays a collected forfeit.
Indicator	Whether the card, the forfeit, and the appeal route are visible before both choices lock. This is not indicator 16.6.1 or 16.6.2.
Baseline	The misaligned card with no forfeit. Equilibrium (Verify, Break), payoffs (2, 10).
Evidence status	The equilibrium is computed. Seven pairs did not raise Keep. No procurement outcome is observed.
Risk	Target 10.2 is: "By 2030, empower and promote the social, economic and political inclusion of all, irrespective of age, sex, disability, race, ethnicity, origin, religion or economic or other status." A flat forfeit of 5 asks who can pay. Not measured. Not indicator 10.2.1.
Safeguard	Proposed only, and not built in the model or the Space. Name the payer and show whether the forfeit was collected. A written objection may be filed before collection. Any filing fee would be capped or waived, because a fee would worsen the target 10.2 question of who can pay. If it is not collected, the flip is not claimed.

H.1 Release audit

The model, notebook, and seven sessions checked in this paper are commit `b1380f7`. Hugging Face is the Space named in Section 5. The poster location is the README link in Section 5. The 20 October 2026 message to Prof. Rogerson is the entry above. No reply had been received as of that date.

Zijie Wang and Lin Zhang are the in-class contributors of ideas named in the acknowledgments. The 2056 statement uses the official 2026 and 2025 prize pages and says the statement does not change.
